OBJECT ORIENTED PROGRAMMING

EPISODE - ③

What we are going to cover:

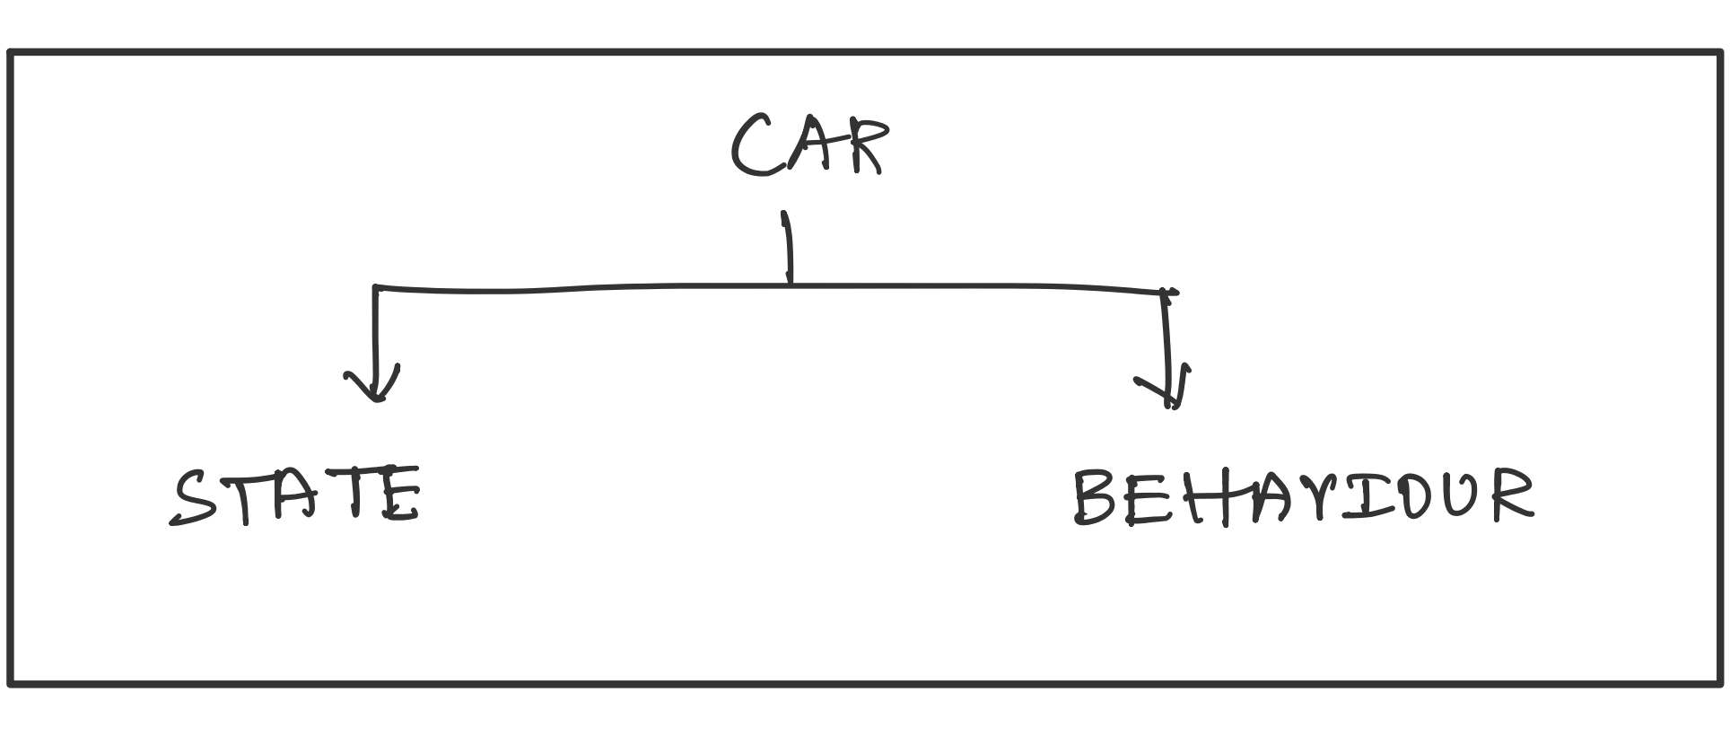
① Attributes

② Methods

③ state

④ Behaviour

What's actually inside an object?



State → What it knows

Behaviour → What it can do

ATTRIBUTES

* Attributes represent the Data / state of an object.

Example:

Car 1

colour = GREEN
speed = 50
fuel = 75

colour, speed, fuel
↓
Attributes

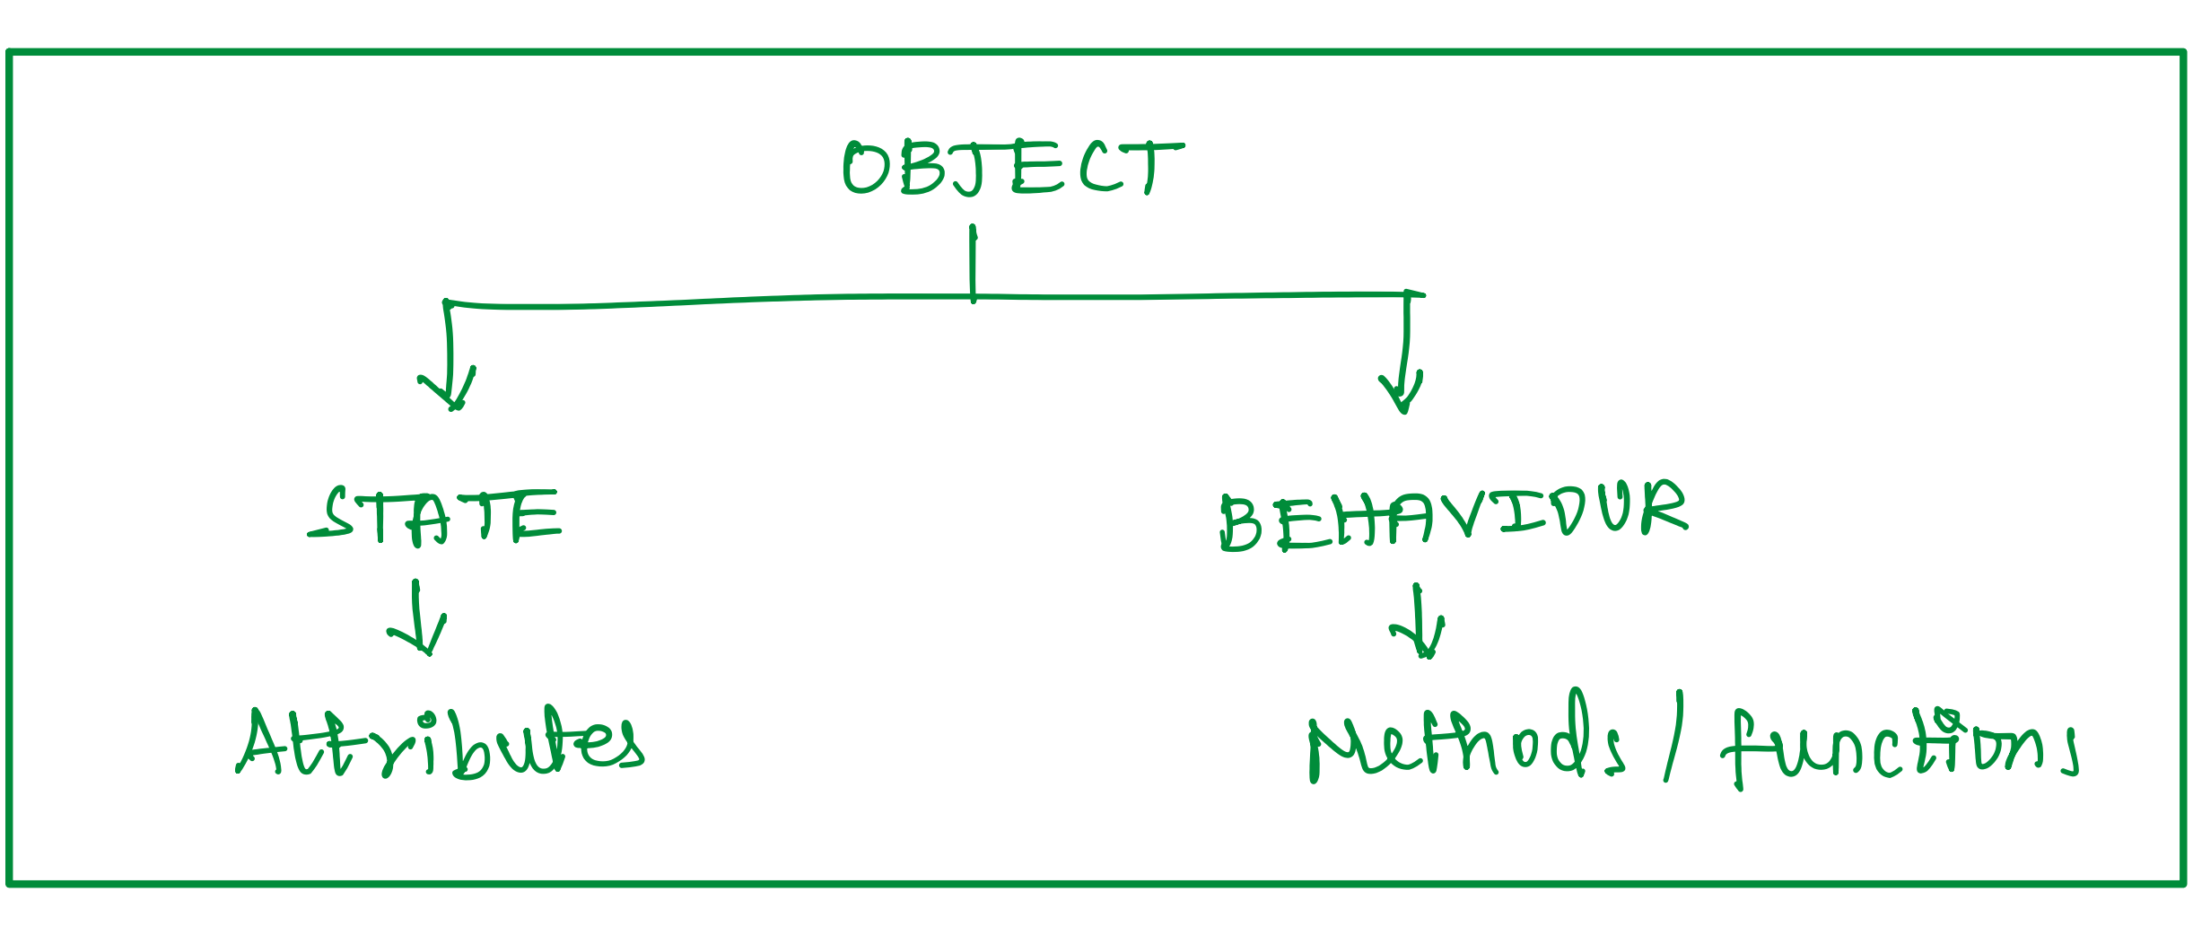
Terminology may vary:

→ Field
→ Attribute
→ Property
→ Member variable

METHODS

* Methods represent the BEHAVIOUR / OPERATIONS associated with that object.

→ star ()
→ accelerate ()
→ brake ()
→ stop ()



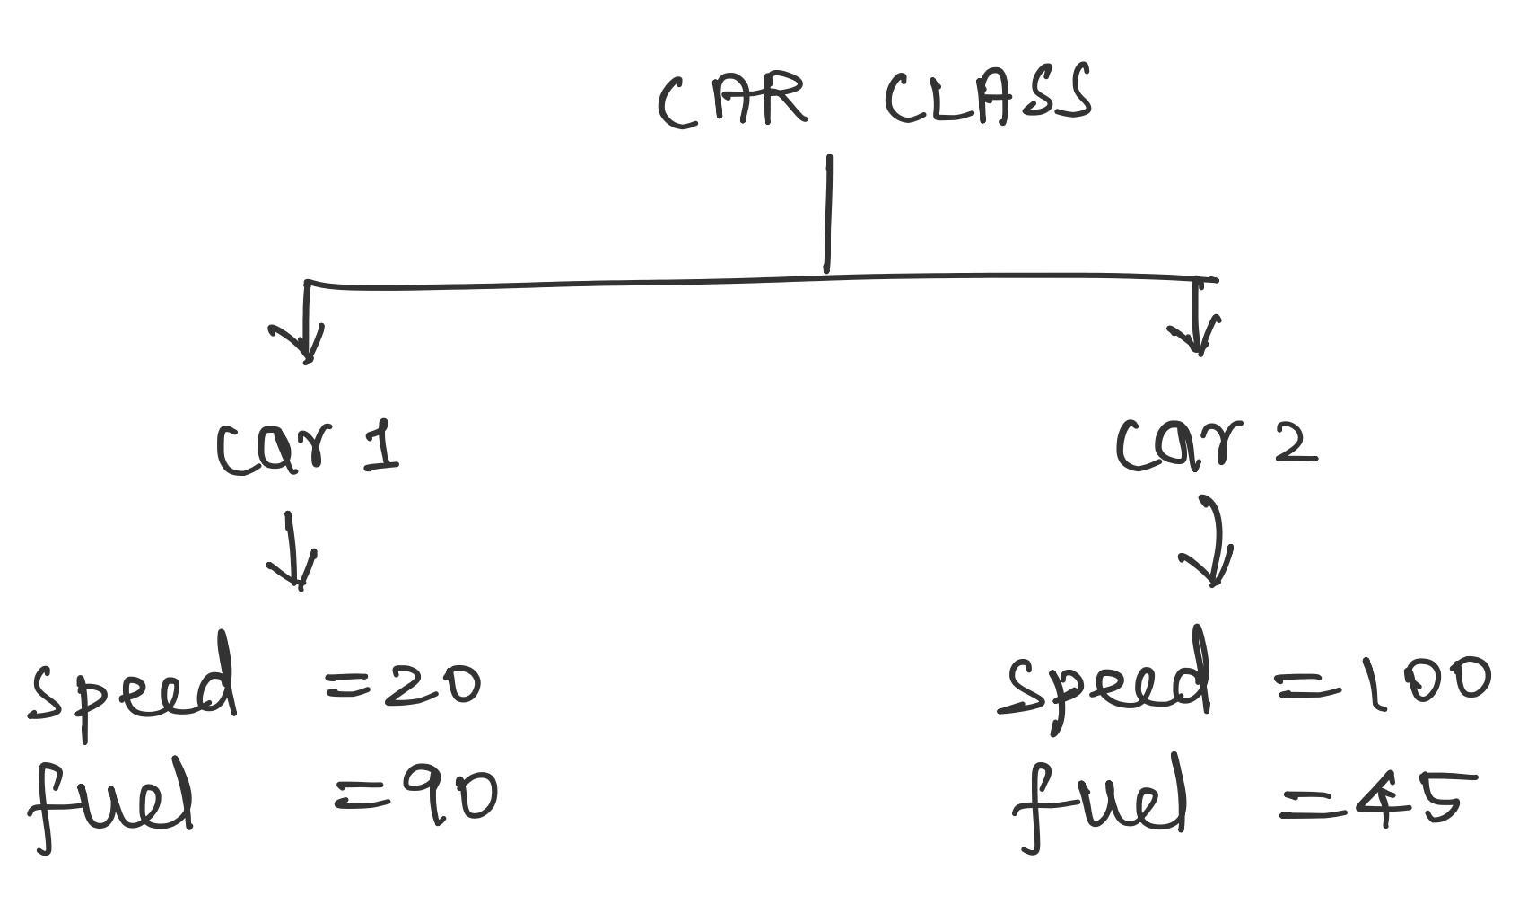
STATE CHANGES

>> car1
>> speed = 0

⇒ accelerate ()
↓
speed = 20
↓
accelerate ()
↓
speed = 40

* Methods can operate on & change the Object state

Two Objects:



>> car1. accelerate ()
↓
car1. speed changes

* car2. speed remains unchanged

Key takeaway:

Each object has its own state

OBJECT:

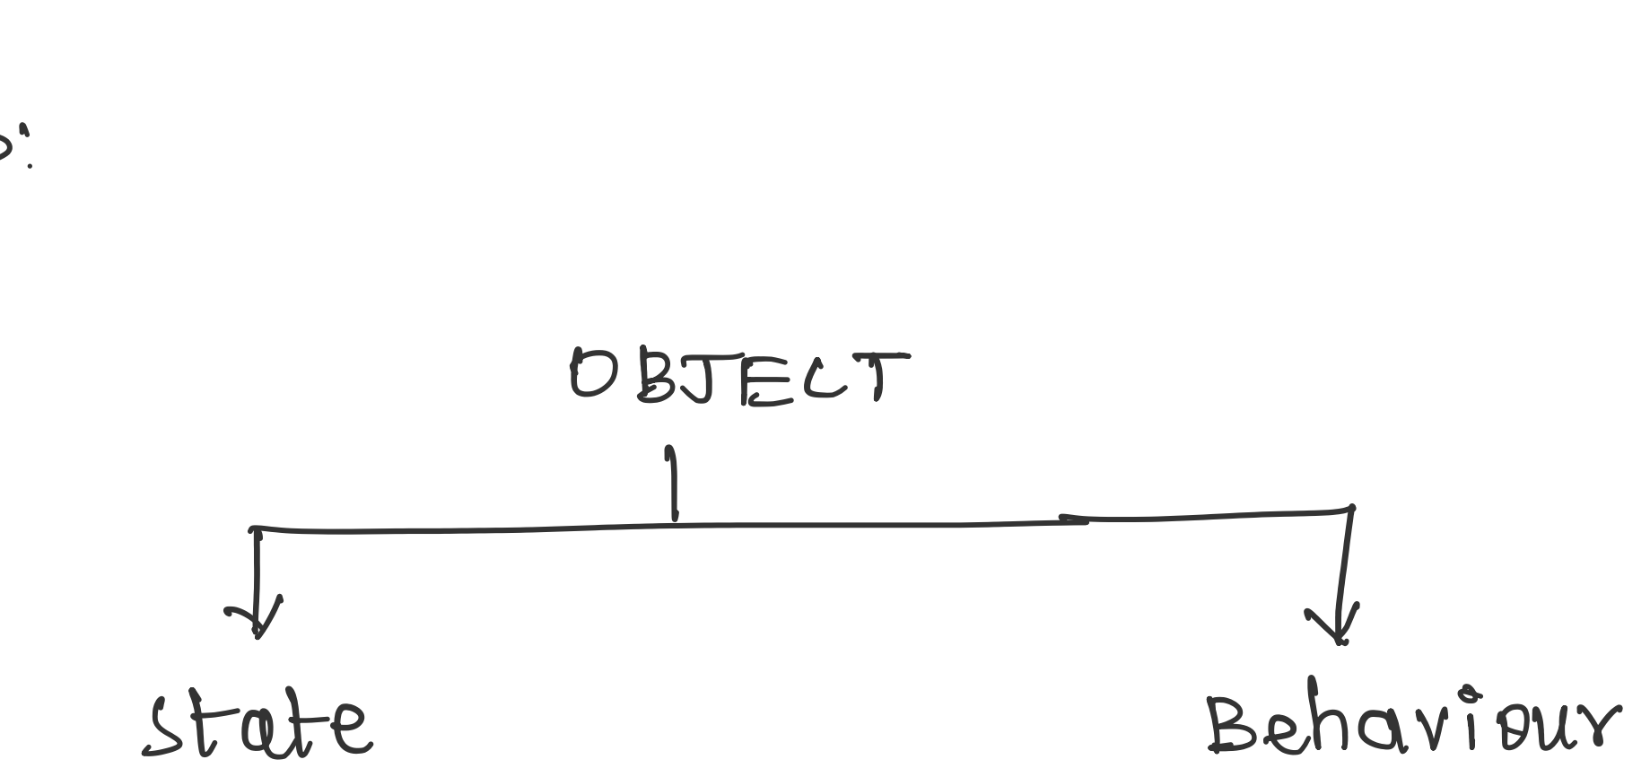
STATE

* colour
* speed
* fuel

BEHAVIOUR

* accelerate ()
* brake ()

Recap:



NEXT VIDEO

We created car1.

But...

who gives car1 its initial values ?
